The Hong Kong Government's Environmental Bureau launched its Energy Saving Plan in May 2015, and page 68 outlines the key policy dates, this seminar will introduce some ideas and concepts to lower energy costs. We know the challenges, 90% of electricity consumed is used in our buildings, that equates to 63% of Hong Kong's carbon footprint, but how can society demand improvement without incentives? There is a huge gap, wider than the grand canyon, between creating a building in accordance with the 'Design Standard' and the actual building energy performance. Once dissatisfaction with building energy costs reaches the board room, what next?

Speakers

Tom Jones, BSRIA – topic: Leaky buildings and tightness standards

Paul Sat, Swire – topic: Big Data, and detecting problems
